Real FACADE®

More and more builders, designers and architects are opting for using and applying timber and based structures. It is very pleasing that the terms "energy saving" and "green building" are increasingly associated with technologies based on using wood as a basic building material. Living in wood is part of a certain generous and unconstrained approach to life, a return to natural values. It gives a feeling of a cosy, pleasant and warm environment, and this fact is perceived very positively by people. Wood breathes, ensures a pleasant climate and humidity in rooms, and positively affects the human psyche and immune system.

Wood is a natural raw material, renewable, fully recyclable and inexhaustible if managed wisely. Wood has good thermal insulation properties, lower heat conductivity and significantly higher heat storage. The building, therefore, responds very quickly to the need for heat, even when using small heating outputs. This results in energy and operating cost savings for the building. Wood as a natural material opens up creative and technical possibilities that are difficult to realise with other materials.

AU-MEX has been purchasing wood products worldwide for more than 20 years, and façade profiles are one of our company's main sales commodities. During 20 years of operation, we have found serious and quality suppliers in the Czech Republic, Russia, Germany, Canada, Brazil, Indonesia and other countries to offer a comprehensive program of wood species and profiles suitable for facade cladding. REAL FACADE means that the selection of suppliers and the quality of the products delivered are proven by more than 20 years of experience.

AU-MEX Ltd  takes care of distribution in the Czech market.
